### Libraries

```
library(Rmisc)
library(glmm)
library(ggplot2)
library(tidyr)
library(dplyr)
# library(MASS) library(reshape2) library(reshape)

defaultMar = c(5.1, 4.1, 4.1, 2.1)
```

### Data

Data format is of tab separated values regarding noise on campus. Some variables are shown in the printout below. The response is spmTriv and spmEff which are "trivsel" and "effektivitet", respectively. The response is evaluated for each building block.

#### Load data and reformat

The time is on a unfeasible format, so we format it to total seconds used.

```
## old new
## [1,] "2 minutter 32 sekunder" "152"
## [2,] "1 minutt 58 sekunder" "118"
## [3,] "2 minutter 32 sekunder" "152"
## [4,] "4 minutter 28 sekunder" "268"
## [5,] "2 minutter 45 sekunder" "165"
## [6,] "2 minutter 41 sekunder" "161"
```

```
d$Svartid = ftimes
```

### Initial values

In this section we take the initial look at the data by considering sample means, SDs, conf.ints and some graphs being plots of said values, histograms and more.

### "How many" numbers

How many did something about the noise.

```
# head(d) head(d[,18:(18+6)])
dTiltak = d[, 18:(18 + 6)]
hasAns = function(x) {
    return(sum(x != ""))
}
dTiltakSum = apply(dTiltak, FUN = hasAns, MARGIN = 2)
dTiltakSum

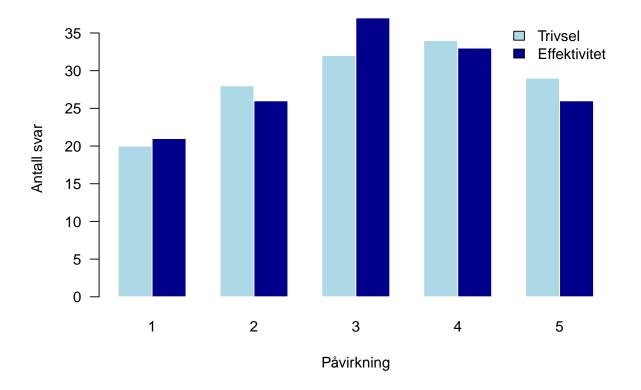

## spmTiltak_1 spmTiltak_2 spmTiltak_3 spmTiltak_4 spmTiltak_5 spmTiltak_6
## 109 26 69 10 66 10
## spmTiltak_7
## 6
```

### Total mean, SD, CI

We compute the sample mean, SD and confidence intervals of effektivitet and trivsel of the entire data set. We also take a look at their distribution by looking at the histograms.

```
effTrivInit = cbind(t(apply(d[, c('spmEff', 'spmTriv')], 2, FUN = CI)), c(sd(d$spmEff), sd(d$spmTriv)))
colnames(effTrivInit) = c(colnames(effTrivInit)[1:3], 'SD')
effTrivInit
##
             upper
                               lower
                       mean
## spmEff 3.33601 3.118881 2.901752 1.313470
## spmTriv 3.38891 3.167832 2.946754 1.337361
# Histograms
histCounts = as.data.frame(rbind(hist(d$spmTriv, breaks = seq(0.5,5.5,1), plot = F)$counts,
               hist(d\$spmEff, breaks = seq(0.5, 5.5, 1), plot = F)\$counts))
rownames(histCounts) = c('trivsel', 'effektivitet')
colnames(histCounts) = 1:5
histCounts
##
                 1 2 3 4 5
                20 28 32 34 29
## trivsel
## effektivitet 21 26 37 33 26
```

```
barplot(
  ((as.matrix(histCounts))),
  col = c("lightblue", 'darkblue'),
  border = "white",
  # main="Trivsel",
  ylab="Antall svar",
  xlab = "P\u00E5virkning",
  beside = T,

  # ylim = c(0,5)
  # space=0.1
)
legend(
  "topright",
  legend = c("Trivsel", "Effektivitet"),
  fill = c("lightblue", 'darkblue'), bty = 'n')
```

## Per Building Analysis

Let's look at some initial per building data.

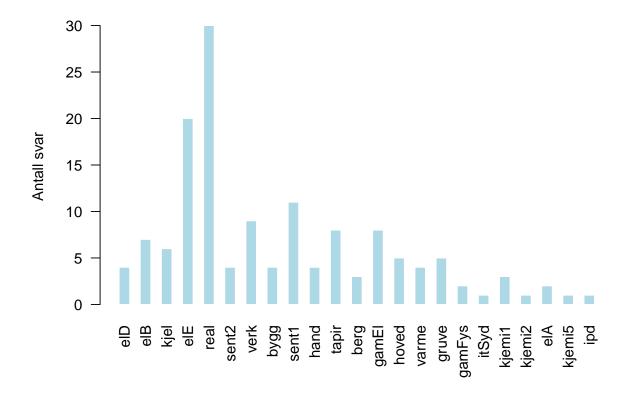

```
# All locations/buildings
locs = unique(d$spmHvor) # all locations in this dataset
buildInit = data.frame(
 matrix(ncol=length(locs),
        nrow=5,
        dimnames=list(c('count', 'meanEff', 'SDEff', 'meanTriv', 'SDTriv'), locs))
)
for (loc in locs){
 buildInit[loc] = c(sum(d$spmHvor==loc),
            mean(d$spmEff[d$spmHvor==loc]),
             sd(d$spmEff[d$spmHvor==loc]),
            mean(d$spmTriv[d$spmHvor==loc]),
             sd(d$spmTriv[d$spmHvor==loc]))
}
round(buildInit,1)

## Pairs plots

Visualization of each data value compared to each other. Neat for initial data observations.

```
# pairs(dNumeric[,2:7])
library(GGally)
dNumeric = select_if(d, is.numeric)
ggpairs(dNumeric[, 2:7]) # Trivsel pairs
```

ggpairs(dNumeric[, 8:13]) # Effektivitet pairs

## Noise type analysis

In this section we will take a look at each noise type and how much people feel like it influences their efficiency and well-being. First we consider what each individual has set the noise type influence e.g., byggestoy1= 3, and then we consider a weighted result where the wights are the overall influence divided by 5, e.g., effektivitet/5\*byggestoy1.

### These uncertainties might be wrong!

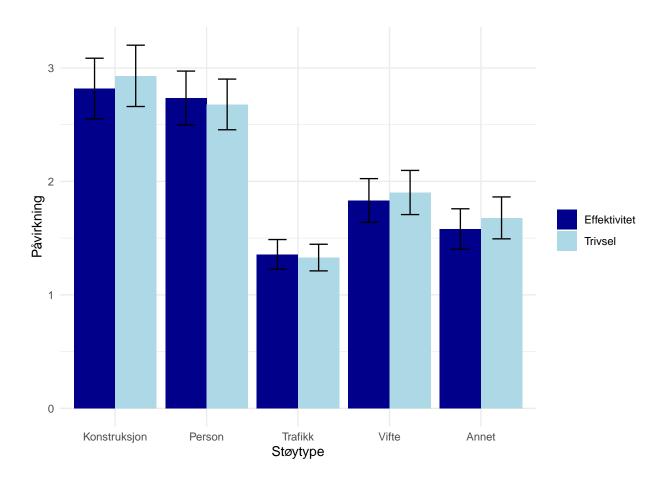

```
ntDfW = data.frame(cbind(nts = 1:length(nts), meanEff = apply(d[, ntEff] * (d$spmEff/5),
    FUN = mean, MARGIN = 2), sdEff = apply(d[, ntEff] * (d$spmEff/5), FUN = sd, MARGIN = 2),
    meanTriv = apply(d[, ntTriv] * (d$spmEff/5), FUN = mean, MARGIN = 2), sdTriv = apply(d[,
        ntTriv] * (d$spmEff/5), FUN = sd, MARGIN = 2)))
# Plot not weighted
